1. History

Date	Author	Change
02.04.2001	Hank Donald	Initial document Release, Version 1.00

1.1. Guideline ID's

Author	last ID	free ID's

2.Introduction

2.1. Motivation

The MAAB guidelines are an important basis for project success and teamwork - not only in-house, but also when cooperating with our partners or subcontractors.

Respecting the guidelines is one key prerequisite to achieving ...

- system integration without problems.
- clean interfaces.
- uniform appearance of models, code and documentation.
- reusable models.
- readable models.
- hassle-free exchange of models
- avoidance of legacies.
- a clean process
- professional documentation.
- understandable presentations.
- fast software changes.
- cooperation with subcontractors.
- handing over of (research or predevelopment) projects (to product development)
- ...

this means functionality, quality, safety, reduced time-to-market and cost reduction !

Disclaimer:

The MAAB guidelines are still under construction, resulting in frequent additions and changes of guidelines.

Please check regularly for updates of the guideline document!

2.2. Guideline template

All guidelines are described using the following template:

ID: Title	db_ xxxx: Title of the guideline (unique, short)
Priority	One of mandatory / strongly recommended / recommended
Scope	One of MAAB /DC / DC-POWERTRAIN / DC-CHASSIS/ FORD /FORD-POWERTRAIN/TOYOTA/GM
Automation	One of check / correction / possible / none
Prerequisites	Links to guidelines, which are prerequisite to this guideline (ID+title)

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

Description	Description of the guideline (text, images)
Benefit	Benefit of respecting the guideline
Penalty	Penalty of breaking the guideline
Author	Name of the first author or name of the source document
Last Change	Date of last change, Author of last change

Note: The elements of this template are considered to be the minimum required items that must be present for proper understanding and exchange of guidelines. The addition of project- or vendor fields to this template is possible as long as their meaning does not overlap with any of the existing fields. In fact, such additions are even encouraged if they help to integrate other guideline templates and lead to a wider acceptance of the core template itself.

2.2.1. Guideline ID:

- The guideline ID is build out of two lowercase letters and a four digit number, separated by an underscore.
- Each guideline author starts with ID's counting up from zero. There should be no gap in ID's numbers.
- Once a new guideline has an ID, it is fixed to this guideline.
- The ID is used for references to guidelines and for the checker filenames.

Note: The letters for the guideline ID are necessary to subdivide the range of IDs to avoid collisions. They are typically taken from the authors initials, however there are no implied underlying semantics, i.e. any two letters (e.g. qx) will do.

2.2.2. Guideline title:

- The title should be a short, but unique description of the guidelines area of application (e.g. length of names)
- The title is used for the "prerequisites"-field and for custom checker-tools.
- There should be a hot link with the title-text. It is used for links to the guideline.

Note: The title should not be a redundant short description of the guidelines content, because while the latter may change over time, the title should remain fairly stable. Priority:

2.2.3. Priority:

Each guideline must be rated with one of the priorities "mandatory", "strongly recommended" or "recommended". The priority not only describes the importance of the guideline but also determines the consequences of violations.

mandatory	strongly recommended	recommended
DEFINITION		
<ul style="list-style-type: none"> guidelines that all companies agree to that are absolutely essential guidelines that all companies conform to 100% 	<ul style="list-style-type: none"> guidelines that are agreed upon to be a good practice, but legacy models preclude a company from conforming 100% to this guideline 	<ul style="list-style-type: none"> guidelines that are recommended to improve the appearance, but are not critical to running the model these guidelines will traditionally appear in project specific guidelines
CONSEQUENCES If the guideline is violated ...		
<ul style="list-style-type: none"> essential things are missing the model may not work properly 	<ul style="list-style-type: none"> the quality and the appearance will deteriorate there is a greater risk of consequences in maintainability, portability, and reusability 	<ul style="list-style-type: none"> the appearance will not conform with other projects
WAIVER POLICY If you decide to violate this guideline...		
<ul style="list-style-type: none"> You must document your reasons, etc., etc This is only an example of the waiver policy. 		

2.2.4. Scope:

One of (at the moment) "MAAB", "DC", "DC-POWERTRAIN", "DC-CHASSIS", "FORD", "FORD-POWERTRAIN", "GM", "TOYOTA".

- "MAAB" is a group of automotive manufacturers, which work closely together with TMW (The MathWorks).
- "DC" is the whole DaimlerChrysler Company.
- "DC-POWERTRAIN" is the scope for powertrain specific rules within DaimlerChrysler
- "DC-CHASSIS" is the scope for chassis system specific rules within DaimlerChrysler
- "FORD" is the whole Ford Company.
- "FORD-POWERTRAIN" is the scope for powertrain specific rules within Ford
- "GM" is the whole General Motors Company
- "TOYOTA" is the whole Toyota Company

Other scopes, for example the project prefix for project specific guidelines can be added.

2.2.5. Automation:

One of "correction", "check", "possible" or "none".

- **Correction:** check and (semi-) automatic correction is possible and is already available
- **Check:** check is possible and there is a checker for this guideline available. The checker-name is the ID of the guideline.
- **Possible:** check is possible but has not been implemented yet.
- **None:** It's not possible to automatically check compliance to the guideline.

2.2.6. Prerequisites:

- This is a field for links to other guidelines, which are prerequisite to this guideline (logical conjunction).
- The guideline ID (for consistency) and the title (for readability) have to be used for the links.
- The "Prerequisites"-field should contain no other text.

2.2.7. Description:

- The "Description"-field contains a detailed description of the guideline.
- If needed, images and tables can be added.
- .Note: If formal notation (math, regular expression, syntax diagrams, exact numbers/limits) is available it should be used to unambiguously describe a guideline and specify an automated check. However a human understandable informal description must always be provided for daily reference.

2.2.8. Benefit:

- The "Benefit"-field contains a description of the advantages of respecting the guideline.
- If needed, images and tables can be added.

Note: This field is an important basis for deciding whether or not to adopt or follow the guideline. The content should be as specific as possible (not: "quality is improved")

2.2.9. Penalty:

- The "Penalty"-field contains a description of the disadvantages of breaking the guideline.
- If needed, images and tables can be added.

Note: This field is an important basis for deciding whether or not to adopt or follow the guideline. The content should be as specific as possible (not: "quality is reduced")

2.2.10. Author:

- The "Author"-field contains the original author or the source document of the guideline.
- The format is "firstname lastname".

Note: This field serves as contact information for questions and change requests regarding the guidelines and also documents the ownership or responsibility for maintaining the guideline

2.2.11. Last change:

- The "Last change"-field contains the date and the author of the last change.
- The format is dd.mm.yyyy, firstname lastname.

2.3. Guideline writing

When writing a new guideline, there are several things to keep in mind. This section describes the most important ones of them and gives more detailed instructions on how to fill in the template. Above all, every guideline should be

- understandable and unambiguous
- easy to find
- motivating
- minimal

With "understandable and unambiguous", we mean that the description of the guideline should describe precisely the state of guideline conformance (something that is in a certain way, has a certain property or something that must be done). So words like "should", "could", "might", ... must be avoided. Note: Since most tips in this section are not hard and fast rules, we will still use them here. This is not only important for understanding by developers but also in terms of specifications for automated checks. If it is not obvious, the description should also describe how the conformant state can be reached (e.g. by

selecting some option, clicking a certain button, ...). Counterexamples and/or screenshots/illustrations may be provided as necessary. The description itself should be short and succinct, but additional notes may be provided in an extra paragraph. An important thing to keep in mind is the avoidance of exceptions, since they blur the guideline and make it harder to apply. One exception to a rule might be ok, but if there are many, you might be trying to cover too many things in one place (see "minimal" below). In this case, it is better to break the guideline down into smaller ones. Also, some exceptions can easily be expressed as separate guidelines that restrict the original one (see [Guideline Interaction Semantics](#) below) and may also have a smaller (i.e. manufacturer, division or project) scope.

The "easy to find" requirement affects the title of the guideline and its placement in the table of contents. Just like a heading in a document describes the subject and not the content of the following chapter, the (permanent) title of a guideline should not be a summary of the description of the guideline (which may change) but indicate its area of application. For example, a guideline may concerns the area "allowed characters in names"(=title) and then specify, that "no special characters may be used"(=description). Such a title also gives a hint about where (in which chapter) to place (or look for) the guideline. If the guideline has prerequisites, they should be listed above/before the dependent guideline (this may not always be possible if the prerequisite is in a different section). Remember: the guideline-ID has no semantics (e.g. order of guidelines) and prerequisites must be of same or wider scope. Of course, circular prerequisites must be avoided.

By "motivating" we mean that it should be "a pleasure to follow the guideline". The benefits and penalties play an important part here. Many developers see guidelines as a burden that causes extra work and limits their creative freedom. It is the purpose of the benefits and penalties to convince them otherwise. Therefore, those two fields should be filled in with care. Generic statements like "improves quality" or "prevents errors" must be avoided. Instead, describe the aspect of quality affected (e.g. readability, maintainability, reliability,...) or the exact error (custom tool malfunction, runtime error, type mismatch, ...).

Lastly, with "minimal" we would like to point out, that a guideline should address only one thing at a time. In other words, guidelines should be atomic. So instead of writing a super-guideline that tries to prevent errors and make things look good at the same time, make it two and maybe connect them with a prerequisite (we might care about looks only after everything works - but then again if nobody understands it, it might never work...). As another example, don't specify fonts, colors and layout in one guideline. It is very hard to get many people (at a wide scope) to agree on many things at the same time. In fact, there is a danger that the compromise reached in the end is so soft and abstract; it is not good for anything. Either way, progress comes easier in small steps. Also, small guidelines are much more resilient to change than a big guideline which eventually will end up containing many exceptions which blur its original intent and make it hard to understand (see above).

2.4. Document usage

The following paragraphs give some directions on how to use this document for reference and for compiling a project-specific guideline document

2.4.1. Guideline Organization

The document is structured as follows: The top level consists of a few introductory and explanatory chapters (like this one) a global chapter for custom tool or domain independent guidelines (e.g. Operating System / Files, MATLAB[®], Simulink[®], Stateflow[®], Handcode...). and one chapter for every relevant custom tool or domain. The hierarchy of sections within each such chapter follows the hierarchy suggested by the custom tool or domain, e.g. directories and files for the operating system, functions and libraries for programming languages / environments, models, submodels, blocks and libraries for modeling tools, etc.

2.4.2. Guideline Interaction Semantics

The guideline document contains many guidelines that are related, similar or even (seemingly) contradicting each other. Following is a description of how the interaction of multiple guidelines works:

- Guidelines in the Global chapter are valid for all the tools and domains in the other chapters.
- Guidelines in a specific chapter specialize (replace, supersede, overwrite, overload) guidelines from the Global chapter.
- Guidelines from a specific subsection in any chapter specialize (replace, supersede, overwrite, overload) guidelines from a higher-level section.
- Prerequisite guidelines reinforce the guideline by which they are referenced. Both the prerequisite **and** the referring guideline must be complied with (logical conjunction).

Note on Specialization: the notion of guideline specialization is similar to the concept of overloading in object-oriented programming. While a specific guideline does replace the higher-level guideline (i.e. the higher level guideline is no longer valid), it typically does so by means of specialization, i.e. it will comply with it but impose additional constraints. This may be expressly documented by describing the constraints only and including the higher-level guideline as a prerequisite (again, this is similar to OO where the overloading function often first calls its overloaded counterpart). In rare cases however, a specific guideline may also contradict its higher-level counterpart by allowing specific exceptions. Such exceptions should not be included in the higher-level guideline because doing so will move the description away from its specific point of application!

Note on Prerequisites: Since a prerequisite is used to reinforce a guideline, it may not be of lesser scope than the referring guideline. Specific company (i.e., "DC", "FORD", "GM", "TOYOTA", etc.) guidelines can be reinforced by generic ("MAAB") guidelines, but not vice versa. From a different perspective, the referring guideline extends the prerequisites (see specialization above). A specific guideline may extend a generic one but the other direction does not make sense.

2.4.3. Guideline Lookup

When looking for a guideline, one should start at the most specific subsection of the affected tool or domain and then ascend the hierarchy up until an appropriate guideline is found. If no appropriate guideline can be found in the chapter on the specific tool / domain, check the Global chapter - again starting at the most specific subsection. When a guideline has been found, follow the links in the template to find all the prerequisite guidelines that must also be followed (see interaction semantics above).

3. Global

3.1. General

3.1.1. db_0112: Indexing

ID: Title	db_0112: Indexing
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>Indexing [1, 2, 3,...] is used for</p> <ul style="list-style-type: none"> • MATLAB <ul style="list-style-type: none"> • Workspace variables and structures • Local variables of m-functions • Global variables • Simulink <ul style="list-style-type: none"> • Signal vectors and matrices • Tunable parameter vectors and matrices • m-coded s-function input and output signal vectors and matrices • m-coded s-function tunable parameter vectors and matrices • m-coded s-function local variables • Stateflow <ul style="list-style-type: none"> • Input and output signal vectors and matrices • Tunable parameter vectors and matrices • Local variables <p>Indexing [0, 1, 2, ...] is used for</p> <ul style="list-style-type: none"> • Simulink <ul style="list-style-type: none"> • c-coded s-function input and output signal vectors and matrices • c-coded s-function input tunable parameters • c-coded s-function tunable parameter vectors and matrices • c-coded s-function local variables

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	<ul style="list-style-type: none"> • Stateflow • Custom c-code variables and structures • C-Code • Local variables and structures • Global variables
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • cooperation with subcontractors. • uniform appearance of models, code and documentation.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause errors in functionality, e.g. auto-c-code generation. • may cause misunderstandings with names. • may cause confusing presentations.

4.Simulink

4.1. General

4.1.1. db_0018: Use of Simulink

ID: Title	db_0018: Use of Simulink
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>Simulink is used to ...</p> <ul style="list-style-type: none">• model controller difference equations.• model controller test environments.• simulate systems or subsystems.• generate auto-c-code of systems or subsystems.. <p>Simulink is not used to ...</p> <ul style="list-style-type: none">• model significant control flow and logic.
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none">• efficient models and auto-c-code.• readability.• eliminates complex logic within Simulink.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none">• may cause inefficient models or auto-c-code.

4.1.2. jm_0001: Prohibited Simulink standard blocks inside controllers

ID: Title	jm_0001: Prohibited Simulink standard blocks inside controllers
Priority	Mandatory
Scope	MAAB
Automation	Possible
Prerequisites	
Description	Controller models must only be designed from discrete blocks.
	Sources are not allowed:
	<div> <div> Signal Generator Step Ramp Sine Wave Repeating Sequence Discrete Pulse Generator Pulse Generator Chirp Signal Clock Digital Clock From File From Workspace Random Number Uniform Random Number Band-Limited White Noise </div> <div>  Signal Generator  Step  Ramp  Sine Wave  Repeating Sequence  Discrete Pulse Generator  Pulse Generator  Chirp Signal  Clock  Digital Clock  From File  From Workspace  Random Number  Uniform Random Number  Band-Limited White Noise </div> </div>
	Continuous blocks are not allowed:
	<div> Integrator Derivative Memory Transport Delay Variable Transport Delay State-Space Transfer Fcn Zero-Pole </div> <div>  Integrator  Derivative  Memory  Transport Delay  Variable Transport Delay  State-Space  Transfer Fcn  Zero-Pole </div>
	Other blocks. which are not allowed:

	<div style="display: flex; align-items: center;"> <div style="flex: 1;"> Slider Gain Algebraic Constraint Manual Switch Complex to Magnitude-Angle Magnitude-Angle to Complex Complex to Real-Imag Real-Imag to Complex Hit Crossing Polynomial MATLAB Fcn Goto Tag Visibility Probe </div> <div style="flex: 2; text-align: center;"> </div> </div>
Benefit	Respecting the guideline ensures ... <ul style="list-style-type: none"> A controller that more closely represents the way it will be implemented.
Penalty	Breaking the guideline ... <ul style="list-style-type: none"> will not be able to use triggered or enabled subsystems will not be able to convert to fixed-point
Author	Judy May
Last Change	14.02.2001, Hank Donald

4.1.3. hd_0001: Prohibited Simulink Sink and Data Store blocks

ID: Title	hd_0001: Prohibited Simulink Sink and Data Store Blocks
Priority	Strongly Recommended
Scope	MAAB
Automation	Possible
Prerequisites	
Description	Controller models must only be designed from discrete blocks.

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	<div><div><div>Sinks are not allowed:</div><div><div><div>Scope XY Graph Display To File To Workspace Stop Simulation</div><div><div><div><div> Scope</div><div><div> XY Graph</div><div><div> Display</div></div></div><div><div><div> To File</div><div><div> To Workspace</div><div><div> Stop Simulation</div></div></div></div></div></div><div><div><div>Other blocks, which are not allowed:</div><div><div><div>Data Store Read Data Store Memory Data Store Write</div><div><div><div><div> Data Store Read</div><div><div> Data Store Memory</div><div><div> Data Store Write</div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div>

4.2. Colors

4.2.1. db_0008: Simulink window screen color

ID: Title	db_0008: Simulink window screen color
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<ul style="list-style-type: none"> All Simulink windows should have a white screen color.

	
Benefit	<p>Respecting the guidelines ensures ...</p> <ul style="list-style-type: none"> • uniform appearance of models.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • cause an ugly appearance of models.
Author	Daniel Buck
Last Change	14.03.2000, Judy May

4.3. Project models and libraries

4.3.1. General

4.3.1.1. db_0043: Simulink font and font size

ID: Title	db_0043: Simulink font and font size
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>All elements (blocks, signal labels,...) except text annotations within a model must have the same common font style and font size.</p> <p>Note: The selected font should be directly portable (e.g. Simulink/Stateflow default font)</p>

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	or convertible between platforms (e.g. Arial/Helvetica 12pt).
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • readable models. • uniform appearance of models (screen and printer). • reusable models. • understandable presentations. • ensures platform independency.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause unreadable models. • may cause a lot of redesign work. • may cause problems when switching to different platforms.
Author	Daniel Buck
Last Change	01.06.2000, Judy May

4.3.1.2. db_0031: Simulink window appearance

ID: Title	db_0031: Simulink window appearance
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>All Simulink windows apply to the following rules:</p> <ul style="list-style-type: none"> • The zoom factor is 100 % (normal).

	
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • readable models. • uniform appearance of models. • reusable models. • understandable presentations.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause unreadable models. • may cause a lot of redesign work.
Author	Daniel Buck
Last Change	07.03.2000, Daniel Buck

4.3.1.3. db_0032: Simulink signal appearance

ID: Title	db_0032: Simulink signal appearance
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>Signal lines ...</p> <ul style="list-style-type: none"> • should not cross each other, if possible.

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	<ul style="list-style-type: none"> • are drawn with right angles. • are not drawn one upon the other. • do not cross any basic-blocks, subsystems. <p>If signal lines are branched the mark point of the branching point is situated on the branching point.</p> 
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • readable models. • uniform appearance of models. • reusable models. • understandable presentations. • traceable models.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause unreadable models. • may cause a lot of redesign work. • may make it more difficult for others to understand the diagram.
Author	Daniel Buck
Last Change	03.02.2000, Daniel Buck

4.3.1.4. db_0042: Ports in Simulink models

ID: Title	db_0042: Ports in Simulink models
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>In a Simulink model, the ports comply with the following rules:</p> <ul style="list-style-type: none"> • Inports should be placed on the left side, but they can be moved in to prevent signal crossings. • Outports should be placed on the right side, but they can be moved in to prevent signal crossings. <p>The name of an inport or outport is not hidden. ("Format / Hide Name" is not allowed.)</p>
Benefit	Respecting the guideline ensures ...

	<ul style="list-style-type: none"> • clear interfaces. • readable models. • uniform appearance of models. • may eliminate signal crossings.
Penalty	Breaking the guideline ... <ul style="list-style-type: none"> • may cause unreadable models.
Author	Daniel Buck
Last Change	08.07.2000, Judy May

4.3.1.5. jm_0010: Port Names in Simulink models

ID: Title	jm_0010: Port Names in Simulink models
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	db_0042 Ports in Simulink models
Description	The name of an inport and output block must match the appropriate signal or bus name. Exception: <ul style="list-style-type: none"> • When any combination of an inport block, an output block, and a basic block have the same block name, the inport name should have the “_in” suffix and the output name should have the “_out” suffix.
Benefit	Respecting the guideline ensures ... <ul style="list-style-type: none"> • information is available for report generation
Penalty	Breaking the guideline ... <ul style="list-style-type: none"> • will cause an error because a basic block can not have the same name as an inport block.
Author	Judy May
Last Change	06.05.2000, Judy May

4.3.1.6. db_0141: Data flow in Simulink models

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

ID: Title	db_0141: Data flow in Simulink models
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	The data flow in a model is oriented from left to right.Exception: Feedback loops Sequential blocks are oriented from left to right. Exception: Feedback loops Parallel blocks are oriented from top to bottom.
Benefit	Respecting the guideline ensures ... <ul style="list-style-type: none"> • a clear model structure. • readable models.
Penalty	Breaking the guideline ... <ul style="list-style-type: none"> • may cause problems with integration of imported subsystems. • may cause a lot of redesign work.
Author	Daniel Buck
Last Change	06.05.2000, Judy May

4.3.1.7. db_0142: Position of block names

ID: Title	db_0142: Position of block names
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	The name of all ... <ul style="list-style-type: none"> • systems, • subsystems, • Stateflow-blocks • s-function-blocks • basic blocks are placed below the blocks.
Benefit	Respecting the guideline ensures ...

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	<ul style="list-style-type: none"> • readable models. • working with other models.
Penalty	Breaking the guideline ... <ul style="list-style-type: none"> • may cause a lot of redesign work.
Author	Daniel Buck
Last Change	10.02.2000, Daniel Buck

4.3.1.8. db_0143: Similar block types on the model levels

ID: Title	db_0143: Similar block types on the model levels	
Priority	strongly recommended	
Scope	MAAB	
Automation	possible	
Prerequisites		
Description	Every level of a model must be designed with building blocks of the same type. (i.e. only subsystems or basic blocks).	
	<div><div>Blocks which can be placed on every model level:</div><div><div><div>Inport</div><div>Outport</div><div>Enable (not on highest model level)</div><div>Trigger (not on highest model level)</div><div>Mux</div><div>Demux</div><div>Bus Selector</div><div>Selector</div><div>Sum</div><div>Ground</div><div>Terminator</div><div>From</div><div>Goto</div><div>Switch</div><div>Multiport Switch</div><div>Merge</div><div>Unit Delay</div></div><div><div><div><div><div><div>1</div><div></div></div><div>In1</div></div><div><div><div>1</div><div></div></div><div>Out1</div></div><div><div><div><div><div></div><div></div></div><div>Enable</div></div><div><div><div><div></div><div></div></div><div>Trigger</div></div></div><div><div><div><div><div><div></div><div></div></div><div>Mux</div></div><div><div><div><div></div><div></div></div><div>Demux</div></div></div><div><div><div><div><div></div><div></div></div><div>Bus Selector</div></div><div><div><div><div><div></div><div></div></div><div>Selector</div></div><div><div><div><div><div></div><div></div></div><div>Sum</div></div></div><div><div><div><div><div><div></div><div></div></div><div>Ground</div></div><div><div><div><div></div><div></div></div><div>Terminator</div></div></div><div><div><div><div><div><div></div><div></div></div><div>From</div></div><div><div><div><div><div></div><div></div></div><div>Goto</div></div></div><div><div><div><div><div><div></div><div></div></div><div>Switch</div></div><div><div><div><div><div></div><div></div></div><div>Multiport Switch</div></div></div><div><div><div><div><div><div></div><div></div></div><div>Merge</div></div><div><div><div><div><div></div><div></div></div><div>Unit Delay</div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div></div>	
Benefit	Respecting the guideline ensures ...	

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	<ul style="list-style-type: none"> • a clear system structure. • readable models.
Penalty	Breaking the guideline ... <ul style="list-style-type: none"> • may cause problems with subsystem integration. • may cause a lot of redesign work. • may cause problems or errors with custom tools.
Author	Daniel Buck
Last Change	23.09.2000, Hank Donald

4.3.1.9. db_0081: Unconnected signals

ID: Title	db_0081: Unconnected signals
Priority	mandatory
Scope	MAAB
Automation	possible
Prerequisites	
Description	A system has ... <ul style="list-style-type: none"> • no unconnected subsystem- or basic block inputs. • no unconnected subsystem- or basic block outputs. • no unconnected signal lines.
Benefit	Respecting the guideline ensures ... <ul style="list-style-type: none"> • a clear system structure. • a clean subsystem interface. • exchangeable subsystem versions. • testable subsystems.
Penalty	Breaking the guideline ... <ul style="list-style-type: none"> • may cause functional errors. • may cause a lot of redesign work. • may cause problems or errors with custom tools.
Author	Daniel Buck
Last Change	08.06.2000, Judy May

4.3.2. Naming

4.3.2.1. Options

4.3.2.1.1. db_0033: Simulink window options

ID: Title	db_0033: Simulink window options
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>The option "View / Toolbar" is activated. The option "View / Status Bar" is activated.</p>  <p>The option "Format / Wide Vector Lines" is activated.</p>

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	 <p>The screenshot shows a software window titled 'db_0033 *'. The menu bar includes File, Edit, View, Simulation, Format, and Tools. The 'Format' menu is open, displaying options: Font..., Flip Name, Show Name, Flip Block (Ctrl+F), Rotate Block (Ctrl+R), Show Drop Shadow, Show Port Labels, Foreground Color, Background Color, Screen Color, Sample Time Colors, Wide Vector Lines (checked), Vector Line Widths, and Port Data Types. The status bar at the bottom indicates 'Display vector signal 100%' and 'ode45'.</p>
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • uniform appearance of models. • the correct assignment of scalar signals and vectors. • readability
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause problems with assignment of scalar signals and vectors.
Author	Daniel Buck
Last Change	07.03.2000, Daniel Buck

4.3.2.2. General

4.3.2.2.1. db_0040: Model hierarchy

ID: Title	db_0040: Model hierarchy
Priority	strongly recommended
Scope	MAAB
Automation	none
Prerequisites	

Description	The model hierarchy corresponds to the logical structures of the vehicle, the system, or the controller.
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • clear model structure. • understandable presentations.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause problems with system integration. • may cause a lot of redesign work. • may cause confusing presentations.
Author	Daniel Buck
Last Change	06.05.2000, Judy May

4.4. System structure

4.4.1. General

4.4.1.1. db_0145: System controller

ID: Title	db_0145: System controller
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>A system should have no more than one dedicated control specification (i.e. a Stateflow diagram) that calculates the system state and may also define trigger signals for subsystems that only perform algorithmic calculations (i.e. Simulink diagrams). <i>Note:</i> Simple systems may not need a separate control specification. In complex systems, the control specification may only be broken down hierarchically but not split into parallel control subsystems on the same level.</p>
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • clear system structure. • understandable presentations.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause problems with system integration. • may cause a lot of redesign work.

	<ul style="list-style-type: none"> • may cause confusing presentations.
Author	Daniel Buck
Last Change	06.05.2000, Judy May

4.4.2. Subsystems

4.4.3. General

4.4.3.1. db_0144: Use of subsystems

ID: Title	db_0144: Use of subsystems
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	A subsystem is an independently applicable building block, and not a group of blocks because of space problems.
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • a clear system structure. • exchangeable subsystems. • testable subsystems.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause problems with subsystem integration. • may cause problems or errors with custom tools.
Author	Daniel Buck
Last Change	10.02.2000, Daniel Buck

4.4.3.2. db_0146: Triggered or enabled subsystems

ID: Title	db_0146: Triggered or enabled subsystems
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

Description	<p>A subsystem can be triggered, enabled or neither:</p> <ul style="list-style-type: none"> • The trigger or enable block should be located at the top of the subsystem and centered within the subsystem. • The name of the trigger or enable block is the same as the name of the corresponding trigger or enable signal. 
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • a clear system structure. • a clean subsystem interface. • exchangeable subsystem versions. • testable subsystems. • flexibility for all applications.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause problems with subsystem integration. • may cause a lot of redesign work. • may cause problems or errors with custom tools.
Author	Daniel Buck
Last Change	07.03.2000, Daniel Buck

4.5. Basic blocks

Example basic blocks:

4.5.1. General

4.5.1.1. db_0140: Display of basic block mask parameters in the attributes format string

ID: Title	db_0140: Display of basic block mask parameters in the attributes format string
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>Important mask parameters of basic blocks must be displayed in the attributes format string.</p> <div style="display: flex; flex-wrap: wrap; justify-content: space-around;"> <div style="text-align: center;">  <p>Unit Delay <initial=0> <tsample=1></p> </div> <div style="text-align: center;">  <p>Discrete-Time Integrator <initial=0> <tsample=1> <limits=-inf / inf (off)></p> </div> <div style="text-align: center;">  <p>Discrete Zero-Pole <tsample=1> <gain=1></p> </div> <div style="text-align: center;">  <p>Discrete Transfer Fcn <tsample=1></p> </div> <div style="text-align: center;">  <p>Discrete State-Space <initial=0> <tsample=1></p> </div> </div> <div style="display: flex; flex-wrap: wrap; justify-content: space-around; margin-top: 10px;"> <div style="text-align: center;">  <p>Look-Up Table <input=[-5:5]> <output=tanh([-5:5])></p> </div> <div style="text-align: center;">  <p>Look-Up Table (2-D) <row=[1:3]> <column=[1:3]> <table=[4 5 6;16 19 20;10 18 23]></p> </div> <div style="text-align: center;">  <p>Saturation <limits=0.5 / -0.5></p> </div> <div style="text-align: center;">  <p>Quantizer <interval=0.5></p> </div> <div style="text-align: center;">  <p>Backlash <initial=0, width=1></p> </div> </div> <div style="display: flex; flex-wrap: wrap; justify-content: space-around; margin-top: 10px;"> <div style="text-align: center;">  <p>Dead Zone <zone=-0.5 / 0.5></p> </div> <div style="text-align: center;">  <p>Relay <low=(eps,0)> <high=(eps,1)></p> </div> <div style="text-align: center;">  <p>Switch <threshold=0.5></p> </div> <div style="text-align: center;">  <p>Merge <initial=[]></p> </div> <div style="text-align: center;">  <p>Enable <states=held></p> </div> </div>

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	Simulink Blocks	Attribute format string
	Unit Delay	<initial=%<x0>>\n<tsample=%<sampleTime>>
	Discrete-Time Integrator	<initial=%<initialcondition>>\n<tsample=%<sampleTime>>\n<limits=%<lowerSaturationLimit> / %<upperSaturationLimit> (%<limitoutput>)>
	Discrete Zero-Pole	<tsample=%<sampleTime>>\n<gain=%<gain>>
	Discrete Transfer Fcn	<tsample=%<sampleTime>>
	Discrete State-Space	<initial=%<x0>>\n<tsample=%<sampleTime>>
	Look-Up Table	<input=%<inputvalues>>\n<output=%<outputvalues>>
	Look-Up Table (2-D)	<row=%<x>>\n<column=%<y>>\n<table=%<t>>
	Saturation	<limits=%<upperlimit> / %<lowerlimit>>
	Quantizer	<interval=%<quantizationinterval>>
	Backlash	<initial=%<initialoutput>, width=%<backlashwidth>>
	Dead Zone	<zone=%<lowervalue> / %<uppervalue>>
	Relay	<low=(%<offswitchvalue>,%<offoutputvalue>)>\n<high=(%<onswitchvalue>,%<onoutputvalue>)>
	Switch	<threshold=%<threshold>>
	Merge	<initial=%<initialoutput>>
	Enable	<states=%<statesWhenEnabling>>
Note:If the attribute format string field is defined as shown in this example, the attributes format string with the associated parameter will appear under the block name automatically.The attribute format string is separate from the block name; therefore, this is not violating any block name guideline.		
Benefit	Respecting the guideline ensures ... <ul style="list-style-type: none"> • readable models. • that information of the block masks is available in SIMUINK windows and screenshots. • blocks do not have to be opened to view mask parameters. • mask parameters can be viewed with the documentation. 	
Penalty	Breaking the guideline ... <ul style="list-style-type: none"> • may cause loss of information. 	

MAAB Controller Style Guidelines For Production Intent

Last Change	17.07.2000, Daniel Buck

4.5.1.2. db_0086: Basic block interface signals

ID: Title	db_0086: Basic block interface signals
Priority	mandatory
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>A basic block ...</p> <ul style="list-style-type: none"> • has no input busses. • has no output busses. • may have an input vector, if the block is vectorized. • may have an output vector, if the block is vectorized.
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • accessible signals. • a clear system structure.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause problems with non-accessible signals. • may cause a lot of redesign work. • may cause problems or errors with custom tools.
Author	Daniel Buck
Last Change	07.02.2000, Daniel Buck

4.5.1.3. jm_0002: Block Resizing

ID: Title	jm_0002: Block Resizing
Priority	mandatory
Scope	MAAB
Automation	possible

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

Prerequisites	
Description	<p>All blocks in a model must be sized such that their icon is completely visible and recognizable. In particular, any text (e.g. tunable parameters, filenames, equations) in the icon must be readable.</p> <p>Note: this guideline requires resizing of blocks with variable icons or blocks with a variable number of inputs and outputs.</p> <p>Correct:</p>  <p>Incorrect:</p> 
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • Readability within the model and the document
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • Difficult for others to read
Author	Judy May
Last Change	18.07.2000, Daniel Buck

4.5.1.4. jm_0008: Ground and Terminator Blocks

ID: Title	jm_0008: Ground and Terminator Blocks
Priority	strongly recommended
Scope	MAAB
Automation	possible

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

Prerequisites	db_0081_Unconnected_signals
Description	All unconnected inputs should be connected to ground blocks. All unconnected outputs should be connected to terminator blocks.
Benefit	Respecting the guideline ensures ... <ul style="list-style-type: none"> eliminates error messages
Penalty	Breaking the guideline ...
Author	Judy May
Last Change	08.06.2000, Judy May

4.5.1.5. jm_0009: Scope of From and Goto Blocks

ID: Title	jm_0009: Scope of From and Goto Blocks
Priority	Strongly Recommended
Scope	MAAB
Automation	none
Prerequisites	db_0032_Simulink_signal_appearance
Description	<p>From and Goto blocks must not be used globally within a model. The Tag of From and Goto blocks is the name of the corresponding signal or bus. The Tag visibility of a Goto block is set to "local".</p>   <p>Note: From and Goto blocks may be used:</p> <ul style="list-style-type: none"> as enable or disable flags to eliminate signal line crossings

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	<ul style="list-style-type: none"> as an interface between rapid prototyping and software-in-the loop
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> readability maintainability eliminates signal crossings
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> causes hidden and undocumented interfaces requires modifying the model for each environment

5.1.5. db_0127: MATLAB commands in Stateflow

ID: Title	db_0127: MATLAB commands in Stateflow
Priority	mandatory

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>The following rules apply to logic in Stateflow:</p> <ul style="list-style-type: none"> • MATLAB functions are not used. • MATLAB instructions are not used. • MATLAB operators are not used. • Project-specific MATLAB-functions are not used.
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • system integration without problems. • a clear system structure. • reusable models. • readable models. • testable systems.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause errors in functionality, e.g. auto-c-code generation. • may cause problems or errors with custom tools. • may cause a lot of redesign work.
Author	Daniel Buck
Last Change	09.02.2000, Daniel Buck

5.1.6. jm_0011: Pointers in Stateflow

ID: Title	jm_0011: Pointers in Stateflow
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	In a Stateflow diagram, pointers to custom code variables are not used.
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • system integration without problems. • a clear system structure. • reusable models.

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	<ul style="list-style-type: none">• readable models.• testable systems.
Penalty	Breaking the guideline ... <ul style="list-style-type: none">• may cause errors in functionality, e.g. auto-c-code generation.• may cause problems or errors with custom tools.• may cause a lot of redesign work.
Author	Judy May
Last Change	05.04.2000, Daniel Buck

5.1.7. db_0129: Stateflow transition appearance

ID: Title	db_0129: Stateflow transition appearance
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>Transitions in Stateflow ...</p> <ul style="list-style-type: none">• do not cross each other, if possible.• are not drawn one upon the other.• do not cross any states, junctions or text-fields. <p>Transition labels can be visually associated to the corresponding transition. Correct:</p>

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

	 <p>Incorrect.</p> 
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • readable models. • uniform appearance of models. • reusable models. • understandable presentations.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause unreadable models. • may cause a lot of redesign work.
Author	Daniel Buck

5.2. Naming

5.2.1. db_0123: Stateflow port names

ID: Title	db_0123: Stateflow port names
Priority	strongly recommended
Scope	MAAB

Automation	possible
Prerequisites	
Description	The name of a Stateflow input/output is the same as the corresponding signal. Exception: Reusable Stateflow-blocks may have different port names. Those port names are constructed like Simulink signal names.
Benefit	Respecting the guideline ensures ... <ul style="list-style-type: none"> • accessible Stateflow signals and tunable parameters. • common name elements..
Penalty	Breaking the guideline ... <ul style="list-style-type: none"> • may cause problems with non-accessible Stateflow signals. • may cause problems with some custom tools.
Author	Daniel Buck
Last Change	11.04.2000, Judy May

5.3. Interface to Simulink

5.3.1. General

5.3.1.1. db_0122: Stateflow/Simulink interface signals and parameters

ID: Title	db_0122: Stateflow/Simulink interface signals and parameters
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	db_0123 Stateflow port names db_0112 Indexing
Description	A Stateflow-block ... <ul style="list-style-type: none"> • has only input signals, input vectors, and no input busses. • has a labeled input signal. • can have tunable parameter inputs • has only output signals and output vectors. • has a labeled output signal. • can have trigger outputs • can be triggered ("File / Chart properties / Update method / triggered"). • uses strong data typing with Simulink (The option "Use Strong Data Typing with

	<p>Simulink I/O" is selected).</p> 
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • a clear system structure. • a clean Stateflow interface. • exchangeable subsystem versions. • testable subsystems.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause problems with subsystem integration. • may cause a lot of redesign work. • may cause problems or errors with custom tools.
Author	Daniel Buck
Last Change	11.04.2000, Judy May

5.4. Internal signals

5.4.1. General

5.4.1.1. db_0125: Scope of internal signals and local auxiliary variables

ID: Title	db_0125: Scope of internal signals and local auxiliary variables
Priority	strongly recommended

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>Internal signals and local auxiliary variables are "Local data" in Stateflow:</p> <ul style="list-style-type: none"> • All local data of a Stateflow-block must be defined on the chart level or below the Object Hierarchy. • There is no local data on the machine level (i.e. there is no interaction between local data in different charts). <p>Correct:</p>  <p>Incorrect:</p> 
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • accessible local data in Stateflow. • a clear system structure. • reusable models. • readable models. • testable systems.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause errors in functionality, e.g. auto-c-code generation. • may cause problems or errors with custom tools. • may cause a lot of redesign work.

5.5. Flowcharts

5.5.1. General

Stateflow Flowchart:

OR

For Stateflow blocks with a Flowchart, see Appendix A. Appendix A is a glossary that compares straight line Flowcharts to curved line Flowcharts. MAAB Guidelines supports both styles; however, one style must be chosen for consistency.

States with Flowcharts:

5.5.1.1. db_0133: Use of patterns for Flowcharts

ID: Title	db_0133: Use of patterns for Flowcharts
Priority	strongly recommended

MAAB Controller Style Guidelines For Production Intent
Release V1.00 Released April 2001

Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>A Flowchart is built with the help of Flowchart patterns (e.g. IF THEN ELSE, FOR LOOP, ...):</p> <ul style="list-style-type: none"> • The data flow is oriented from the top to the bottom. • Patterns are connected with empty transitions.
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • a clear system structure. • reusable models. • readable models. • testable systems.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause errors in auto-c-code. • may cause problems or errors with custom tools. • may cause a lot of redesign work.

5.5.1.2. db_0132: Transitions in Flowcharts

ID: Title	db_0132: Transitions in Flowcharts
Priority	strongly recommended
Scope	MAAB
Automation	possible
Prerequisites	
Description	<p>The following rules apply to transitions in Flowcharts:</p> <p>A transition in a Flowchart has either a condition, a condition action or an empty transition.</p> <p>Transition with condition:</p> 

Transition with condition action:

Empty transition:

Transition actions are not used in Flowcharts. Transitions Actions are only valid when used in transitions between state machines, otherwise they are not activated because of the inherent dependency on a valid state to state transition to activate them.

Transition action:

At every junction, except for the last junction of a flow diagram, exactly one unconditional transition begins. Every decision point (junction) must have a default path

A transition may have a comment:

	<pre> graph LR subgraph Pattern1 direction LR S1(()) -- "/* comment */" --> E1(()) end subgraph Pattern2 direction LR S2(()) -- "[condition]" --> E2(()) end subgraph Pattern3 direction TB S3(()) -- "/* comment */" --> A["{ action; }"] A --> E3(()) end </pre>
Benefit	<p>Respecting the guideline ensures ...</p> <ul style="list-style-type: none"> • a clear system structure. • ensures a valid path from top to bottom of a Flowchart • reusable models. • readable models. • testable systems.
Penalty	<p>Breaking the guideline ...</p> <ul style="list-style-type: none"> • may cause errors in auto-c-code. • may cause problems or errors with custom tools. • may cause a lot of redesign work.

7.1. StateFlow Diagram Object Quick Reference

See MATLAB v6.0 online help document “stateflow.html”. It is an excellent Quick reference guide to StateFlow diagram objects and terminology.

8.Glossary

Actions

Actions take place as part of Stateflow diagram execution. The action can be executed as part of a transition from one state to another, or depending on the activity status of a state. Transitions can have condition actions and transition actions. For example,

States can have entry, during, exit, and, on *event_name* actions. For example,

If you enter the name and backslash followed directly by an action or actions (without the `entry` keyword), the action(s) are interpreted as `entry` action(s). This shorthand is useful if you are only specifying `entry` actions.

The *action language* defines the categories of actions you can specify and their associated notations. An action can be a function call, an event to be broadcast, a variable to be assigned a value, etc.

Action Language

You sometimes want actions to take place as part of Stateflow diagram execution. The action can be executed as part of a transition from one state to another, or it can depend on the activity status of a

state. Transitions can have condition actions and transition actions. States can have `entry`, `during`, `exit`, and, on `event_name` actions.

An action can be a function call, an event to be broadcast, a variable to be assigned a value, etc. The *action language* defines the categories of actions you can specify and their associated notations.

Violations of the action language notation are flagged as errors by the parser. This section describes the action language notation rules.

Chart Instance

A *chart instance* is a link from a Stateflow model to a chart stored in a Simulink library. A chart in a library can have many chart instances. Updating the chart in the library automatically updates all the instances of that chart.

Condition

A *condition* is a Boolean expression to specify that a transition occurs given that the specified expression is true. For example,

The action language defines the notation to define conditions associated with transitions.

Connective Junction

Connective junctions are decision points in the system. A connective junction is a graphical object that simplifies Stateflow diagram representations and facilitates generation of efficient code. Connective junctions provide alternative ways to represent desired system behavior.

This example shows how connective junctions (displayed as small circles) are used to represent the flow of an `if` code structure.

```

if [c1]{
    a1
    if [c2]{
        a2
    } else if [c3]{
        a3
    }
}

```

Or the equivalent squared style

```

if [c1]{
    a1
    if [c2]{
        a2
    } else if [c3]{
        a3
    }
}

```

Name	Button Icon	Description
Connective junction		One use of a Connective junction is to handle situations where transitions out of one state into two or more states are taken based on the same event but guarded by different conditions.

Data

Data objects store numerical values for reference in the Stateflow diagram.

Defining Data

A state machine can store and retrieve data that resides internally in its own workspace. It can also access data that resides externally in the Simulink model or application that embeds the state machine. When creating a Stateflow model, you must define any internal or external data referenced by the state machine's actions

Data Dictionary

The *data dictionary* is a database where Stateflow diagram information is stored. When you create Stateflow diagram objects, the information about those objects is stored in the data dictionary once you save the Stateflow diagram.

Decomposition

A state has *decomposition* when it consists of one or more substates. A Stateflow diagram that contains at least one state also has decomposition. Representing hierarchy necessitates some rules around how states can be grouped in the hierarchy. A superstate has either parallel (AND) or exclusive (OR) decomposition. All substates at a particular level in the hierarchy must be of the same decomposition.

Parallel (AND) State Decomposition.Parallel (AND) state decomposition is indicated when states have dashed borders. This representation is appropriate if all states at that same level in the hierarchy are active at the same time. The activity within parallel states is essentially independent.

Exclusive (OR) State Decomposition.Exclusive (OR) state decomposition is represented by states with solid borders. Exclusive (OR) decomposition is used to describe system modes that are mutually exclusive. Only one state, at the same level in the hierarchy, can be active at a time.

Default Transition

Default transitions are primarily used to specify which exclusive (OR) state is to be entered when there is ambiguity among two or more neighboring exclusive (OR) states. For example, default transitions specify which substate of a superstate with exclusive (OR) decomposition the system enters by default in the absence of any other information. Default transitions are also used to specify that a junction should be entered by default. A default transition is represented by selecting the default transition object from the toolbar and then dropping it to attach to a destination object. The default transition object is a transition with a destination but no source object.

Name	Icon	Description
------	------	-------------

	Icon	
Default transition		Use a Default transition to indicate, when entering this level in the hierarchy, which state becomes active by default.

Events

Events drive the Stateflow diagram execution. All events that affect the Stateflow diagram must be defined. The occurrence of an event causes the status of the states in the Stateflow diagram to be evaluated. The broadcast of an event can trigger a transition to occur and/or can trigger an action to be executed. Events are broadcast in a top-down manner starting from the event's parent in the hierarchy.

Finite State Machine

A *finite state machine* (FSM) is a representation of an event-driven system. FSMs are also used to describe reactive systems. In an event-driven or reactive system, the system transitions from one mode or state, to another prescribed mode or state, provided that the condition defining the change is true.

Flow Graph

A *flow graph* is the set of Flowcharts that start from a transition segment that, in turn, starts from a state or a default transition segment.

Flowchart (also known as Flow Path)

A *Flowchart* is an ordered sequence of transition segments and junctions where each succeeding segment starts on the junction that terminated the previous segment.

Flow Subgraph

A *flow subgraph* is the set of Flowcharts that start on the same transition segment.

Hierarchy

Hierarchy enables you to organize complex systems by placing states within other higher-level states. A hierarchical design usually reduces the number of transitions and produces neat, more manageable diagrams.

History Junction

A *History Junction* provides the means to specify the destination substate of a transition based on historical information. If a superstate has a History Junction, the transition to the destination substate is

defined to be the substate that was most recently visited. The History Junction applies to the level of the hierarchy in which it appears.

Name	Button Icon	Description
History Junction		Use a History Junction to indicate, when entering this level in the hierarchy, that the last state that was active becomes the next state to be active.

Inner Transitions

An *inner transition* is a transition that does not exit the source state. Inner transitions are most powerful when defined for superstates with XOR decomposition. Use of inner transitions can greatly simplify a Stateflow diagram.

Library Link

A *library link* is a link to a chart that is stored in a library model in a Simulink block library.

Library Model

A Stateflow *library model* is a Stateflow model that is stored in a Simulink library. You can include charts from a library in your model by copying them. When you copy a chart from a library into your model, Stateflow does not physically include the chart in your model. Instead, it creates a link to the library chart. You can create multiple links to a single chart. Each link is called a *chart instance*. When you include a chart from a library in your model, you also include its state machine. Thus, a Stateflow model that includes links to library charts has multiple state machines. When Stateflow simulates a model that includes charts from a library model, it includes all charts from the library model even if there are links to only some of its models. However, when Stateflow generates a stand-alone or RTW target, it includes only those charts for which there are links. A model that includes links to a library model can be simulated only if all charts in the library model are free of parse and compile errors.

Machine

A *machine* is the collection of all Stateflow blocks defined by a Simulink model exclusive of chart instances (library links). If a model includes any library links, it also includes the state machines defined by the models from which the links originate.

Nonvirtual Block

Any block that performs some algorithm, such as a Gain block.

Notation

A *notation* defines a set of objects and the rules that govern the relationships between those objects. Stateflow notation provides a common language to communicate the design information conveyed by a Stateflow diagram.

Stateflow notation consists of:

- A set of graphical objects
- A set of nongraphical text-based objects
- Defined relationships between those objects

Parallelism

A system with *parallelism* can have two or more states that can be active at the same time. The activity of parallel states is essentially independent. Parallelism is represented with a parallel (AND) state decomposition.

Real-Time System

A system that uses actual hardware to implement algorithms, for example, digital signal processing or control applications.

Real-Time Workshop[®]

The Real-Time Workshop is an automatic C language code generator for Simulink. It produces C code directly from Simulink block diagram models and automatically builds programs that can be run in real-time in a variety of environments.

RTW Target

An executable built from code generated by the Real-Time Workshop

S-Function

A customized Simulink block written in C or M-code. C-code S-functions can be inlined in the Real-Time Workshop. When using Simulink together with Stateflow for simulation, Stateflow generates an *S-function* (MEX-file) for each Stateflow machine to support model simulation. This generated code is a simulation target and is called the `sfun` target within Stateflow.

Signal propagation

Process used by Simulink to determine attributes of signals and blocks, such as data types, labels, sample time, dimensionality, and so on, that are determined by connectivity

Simulink

Simulink is a software package for modeling, simulating, and analyzing dynamic systems. It supports linear and nonlinear systems, modeled in continuous time, sampled time, or a hybrid of the two. Systems can also be multirate, i.e., have different parts that are sampled or updated at different rates.

It allows you to represent systems as block diagrams that you build using your mouse to connect blocks and your keyboard to edit block parameters. Stateflow is part of this environment. The Stateflow block is a masked Simulink model. Stateflow builds an S-function that corresponds to each Stateflow machine.

This S-function is the agent Simulink interacts with for simulation and analysis.

The control behavior that Stateflow models complements the algorithmic behavior modeled in Simulink block diagrams. By incorporating Stateflow diagrams into Simulink models, you can add event-driven behavior to Simulink simulations. You create models that represent both data and control flow by combining Stateflow blocks with the standard Simulink blocksets. These combined models are simulated using Simulink.

State

A *state* describes a mode of a reactive system. A reactive system has many possible states. States in a Stateflow diagram represent these modes. The activity or inactivity of the states dynamically changes based on events and conditions.

Every state has hierarchy. In a Stateflow diagram consisting of a single state, that state's parent is the Stateflow diagram itself. A state also has history that applies to its level of hierarchy in the Stateflow diagram. States can have actions that are executed in a sequence based upon action type. The action types are: *entry*, *during*, *exit*, or on *event_name* actions.

Name	Button Icon	Description
State		Use a state to depict a mode of the system.

Stateflow Block

The *Stateflow block* is a masked Simulink model and is equivalent to an empty, untitled Stateflow diagram. Use the Stateflow block to include a Stateflow diagram in a Simulink model.

The control behavior that Stateflow models complements the algorithmic behavior modeled in Simulink block diagrams. By incorporating Stateflow blocks into Simulink models, you can add complex event-driven behavior to Simulink simulations. You create models that represent both data and control flow by combining Stateflow blocks with the standard Simulink and toolbox block libraries. These combined models are simulated using Simulink.

Stateflow Debugger

Use the *Stateflow Debugger* to debug and animate your Stateflow diagrams. Each state in the Stateflow diagram simulation is evaluated for overall code coverage. This coverage analysis is done automatically when the target is compiled and built with the debug options. The Debugger can also be used to perform dynamic checking. The Debugger operates on the Stateflow machine.

Stateflow Diagram

Using Stateflow, you create Stateflow diagrams. A *Stateflow diagram* is also a graphical representation of a finite state machine where *states* and *transitions* form the basic building blocks of the system

Stateflow Explorer

Use the *Stateflow Explorer* to add, remove, and modify data, event, and target objects.

Stateflow Finder

Use the *Finder* to display a list of objects based on search criteria you specify. You can directly access the properties dialog box of any object in the search output display by clicking on that object.

Substate

A state is a *substate* if it is contained by a superstate.

Superstate

A state is a *superstate* if it contains other states, called substates.

Target

An executable program built from code generated by Stateflow or the Real-Time Workshop.

Topdown Processing

Topdown processing refers to the way in which Stateflow processes states. In particular, Stateflow processes superstates before states. Stateflow processes a state only if its superstate is activated first.

Transition

A *transition* describes the circumstances under which the system moves from one state to another. Either end of a transition can be attached to a source and a destination object. The *source* is where the transition begins and the *destination* is where the transition ends. It is often the occurrence of some event that causes a transition to take place.

Transition Path

A *transition path* is a Flowchart that starts and ends on a state.

Transition Segment

A *transition segment* is a single directed edge on a Stateflow diagram. Transition segments are sometimes loosely referred to as transitions.

Tunable parameters

A *Tunable parameters* is a parameter that can be adjusted.

Virtual Block

When creating models, you need to be aware that Simulink blocks fall into two basic categories: nonvirtual and virtual blocks. Nonvirtual blocks play an active role in the simulation of a system. If you add or remove a nonvirtual block, you change the model's behavior. Virtual blocks, by contrast, play no active role in the simulation. They simply help to organize a model graphically. Some Simulink blocks can be virtual in some circumstances and nonvirtual in others. Such blocks are called conditionally virtual blocks. The following table lists Simulink's virtual and conditionally virtual blocks

Virtual Blocks	
Block Name	Condition Under Which Block Will Be Virtual
Bus Selector	Always virtual.
Data Store Memory	Always virtual.
Demux	Always virtual.
Enable Port	Always virtual.
From	Always virtual.
Goto	Always virtual.
Goto Tag Visibility	Always virtual.
Ground	Always virtual.

Inport	Always virtual <i>unless</i> the block resides in a conditionally executed subsystem <i>and</i> has a direct connection to an outport block.
Mux	Always virtual.
Outport	Virtual if the block resides within any subsystem block (conditional or not), and does <i>not</i> reside in the root (top-level) Simulink window.
Selector	Always virtual.
Subsystem	Virtual if the block is not conditionally executed.
Terminator	Always virtual.
Test Point	Always virtual.
Trigger Port	Virtual if the outport port is not present.

Virtual Scrollbar

A *virtual scrollbar* enables you to set a value by scrolling through a list of choices. When you move the mouse over a menu item with a virtual scrollbar, the cursor changes to a line with a double arrowhead. Virtual scrollbars are either vertical or horizontal. The direction is indicated by the positioning of the arrowheads. Drag the mouse either horizontally or vertically to change the value.
